

Routing Protocol Visualization and Analysis:

Proactive Routing vs Reactive Routing

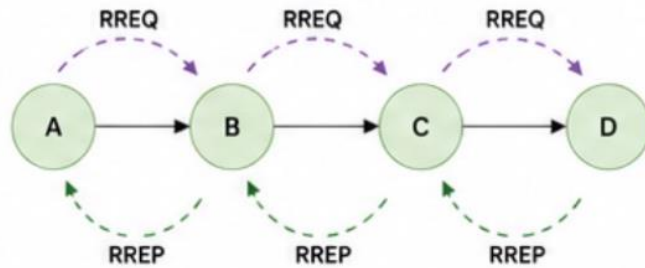

Proactive Routing (Example: OLSR)

- Routes are continuously maintained
- Routing tables are always updated
- Fast route availability
- Higher control overhead
- Suitable for stable networks

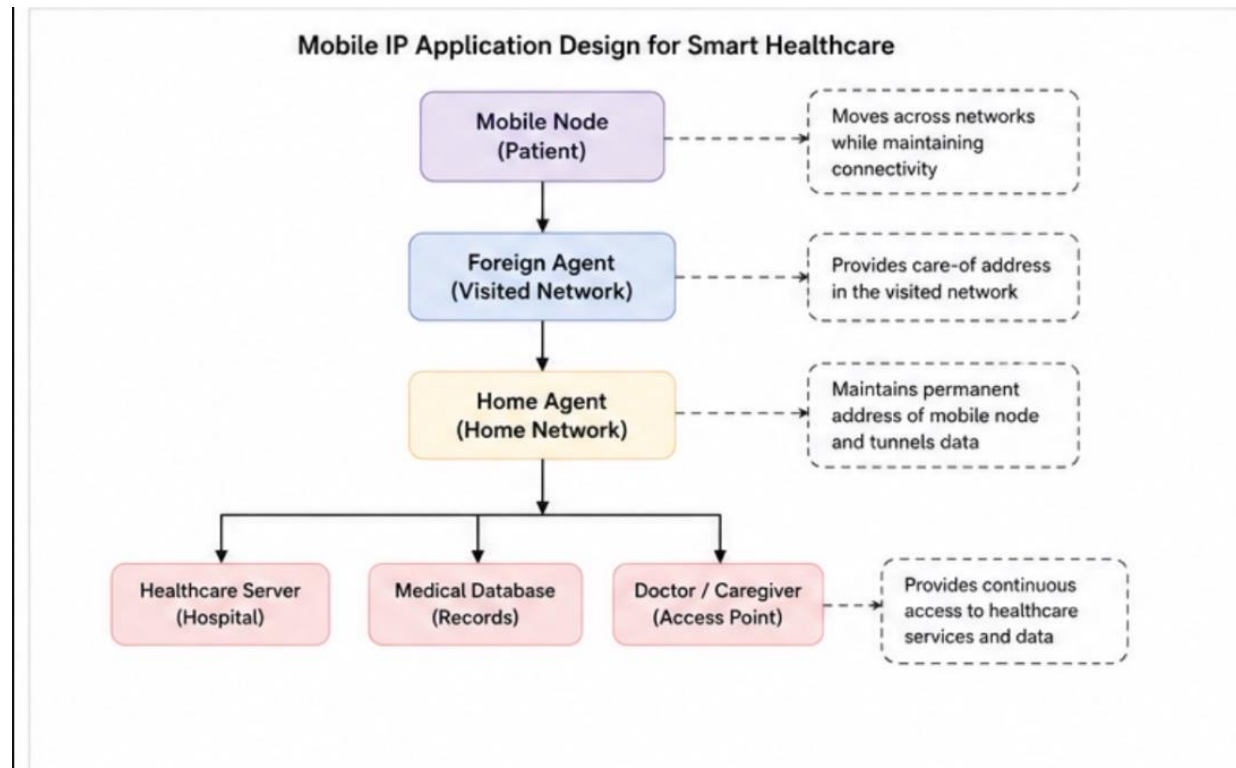

Type: Table-Driven

Reactive Routing (Example: AODV)

- Route is created only when needed
- Lower control overhead
- Initial route discovery delay
- Suitable for highly dynamic networks

Type: On-Demand

Comparative Architecture:

Cellular Wireless Network vs Mobile Ad Hoc Network (MANET)
